

PROTECTIVE DEVICE FOR A MOTOR VEHICLE

ABSTRACT OF THE DISCLOSURE

A protective device for a motor vehicle comprising a flat sheet which is movably supported between a compactly rolled-up rest position and a pulled-out deployed position, which flat sheet is supported over its pull-out path in guideways in the sides of the vehicle. A drive system is associated with the flat sheet on each side thereof. The two drive systems are connected to one another through a mechanical synchronization gearing assembly.
